SUMMARY

Software Engineer with ~2 years building and operating production backend systems for an OTT streaming platform. Java and Spring Boot for a multi-profile video transcoding and packaging pipeline; Laravel and PostgreSQL for a full content management system with 20+ secure REST APIs and role-based access control. Comfortable owning a service end to end — schema design, API surface, asynchronous job processing, failure recovery and query-level performance work. B.Tech CSE, 8.1 CGPA; 200+ DSA problems solved.

TECHNICAL SKILLS

Backend	Java, Spring Boot, PHP, Laravel, Node.js, Express.js, REST API design, service-layer architecture
Databases	PostgreSQL, MySQL, MongoDB — schema design, query optimisation, indexing, caching
Cloud & DevOps	AWS (EC2, S3), Docker, Kubernetes, Nginx, SSL termination, Git, GitHub
Frontend	React.js, JavaScript, HTML5, CSS3, Bootstrap, responsive design
Practices	RBAC, asynchronous job pipelines, retry & idempotent reprocessing, structured error logging, Postman, Agile

EXPERIENCE

Digivive Services Pvt Ltd Oct 2024 – Present · New Delhi
Software Engineer — OTT Platform Solutions

Backend engineer across two production systems on the company's OTT streaming platform: a Java/Spring Boot video transcoding service and a Laravel/PostgreSQL content management system. Owned service design, APIs, database schemas, job-processing workflows and performance work.

Video Transcoding & Packaging Pipeline — Java, Spring Boot, PostgreSQL, Bento4

- Designed and built a video transcoding and packaging pipeline in Java/Spring Boot supporting **multi-profile encoding** — parallel renditions at different resolutions and bitrates from a single source asset — for adaptive streaming delivery.
- Exposed the full job lifecycle over REST: submission, queueing, in-flight progress, terminal state and per-job history, so operators and upstream services could drive and observe the pipeline without touching the box.
- Authored the per-profile transcoding scripts and orchestrated them into an automated end-to-end workflow, removing the manual steps the process previously depended on.
- Integrated **Bento4** to package encoded renditions into streaming-ready formats, producing the segmented output players consume directly.
- Modelled the PostgreSQL schema for jobs, encoding profiles, execution logs and pipeline metadata, giving every run an auditable trail from submission to packaged output.
- Eliminated silent failures in production: classified error cases, added bounded retries, structured error logging and an idempotent reprocessing path so a failed asset could be safely re-driven without duplicating output.

OTT Content Management Platform — Laravel, PostgreSQL, REST, RBAC

- Built the OTT content management platform end to end on Laravel and PostgreSQL: content ingest and upload, publish scheduling, metadata handling and video categorisation across the catalogue.
- Developed and integrated **20+ secure REST APIs** spanning user roles, feature modules, granular permissions and media asset management, consumed by both the admin surface and downstream platform services.
- Implemented **role-based access control** over modules and permissions so admin capability could be scoped per role and scaled to new operator types without code changes.
- Improved backend performance through targeted refactoring, query optimisation and indexing on the heaviest catalogue reads, plus caching on repeat-heavy endpoints.
- Wrote seeder scripts and reproducible schema migrations so the platform could be stood up cleanly across environments.

EDUCATION

Raj Kumar Goel Institute of Technology, Ghaziabad Sep 2021 – May 2025
B.Tech, Computer Science & Engineering — CGPA **8.1 / 10**

Data Structures & Algorithms, OOP, Operating Systems, DBMS, Computer Networks, Computer Architecture
Joined Digivive in Oct 2024 and worked full-time while completing the final year.

ACHIEVEMENTS

- Solved **200+ data structures and algorithms problems** across LeetCode and GeeksforGeeks; active problem-solving practice alongside full-time production work.
